Group 12

Beta Contributions:

Jean-Claude Bissou (Release 33%, Total 33%)

- Added support for uploading videos to Firebase Storage and storing a Posts document when user presses Upload. (Video is also deleted after uploading)
    - Includes timestamp, user, description, tagged_users, privacy, videoURL, thumbnailURL
- Thumbnail (first frame of video) is also uploaded to Firebase Storage and stored under the Post document
- Added popups for users to select privacy and tagged users
- When the Draft button is pressed, video will be saved to local Photo library
- The TimelapseCamera now allows for users to press a settings button and select their desired recording FPS from 2, 5, 10, 15. The video will be played back at 30FPS so 5FPS = 6x speed. The settings also displays in the top-right corner of the camera.
- Update follower/following count after user presses the follow button.
- Navbar icons + text

Ernest Ramos (Release 33%, Total 33%)

- Finished the Create a Profile and Login interface
    - Finished completing the bio picture interface by asking for permission for the app to access the photo library, and inserting the correct protocols to ensure the picture is accessible for all viewcontrollers
    - Also added a default setting if no bio picture is added
    - Debugged All Keyboard Issues we were having
    - Fixed the UI, and ensure all error messages are viewable to the user
- Added the following and unfollowing mechanism
    - Permits the users following and followers list from from both the current user and the user you are viewing to be able to dynamically increase and decrease
    - Adds the followers and the following to our firebase data base to the person you are following the person who gained a follower
    - Ensured that the button to follow and unfollow shows the correct text for all scenarios
    - Added animation for the button as well
- Collaborated to help merge conflicts
- Collaborated to help design the user profile view controller more organized and more intuitive

Andy Trinh (Release 33%, Total 33%)

- Refined the design of the profile view controller on the storyboard by refactoring it into a single collection view
    - Created the collection view such that it is comprised of a custom header collection view cell that displays the user's information such as username, profile

picture, and bio, and a 3 column grid of custom cells, all of which segue to a different view controller if clicked on
- Designed and created a new view controller (TimelapseViewController) that allows the user to view the timelapse (main UI consists of a single table view)
    - Created the table view such that it is comprised of a custom header table view cell that displays the timelapse's information such as description, number of likes, and video content, multiple cells which contain comments, and a single cell purposed to drafting a new comment
- Designed and created a new view controller (FeedPageViewController) that allows the user to view the posts/timelapses queried from the database (main UI consists of a single table view)
    - Created the table view such that it is comprised of custom header table view cells, each of which displays the timelapse's information such as username, profile picture, and number of likes
- Added new segues from FeedPageViewController and ProfileViewController

Kevin Evans (Release 0%, Total 0%)

- Conducted research on settings page designs from leading social media platforms such as Instagram and TikTok to identify common UX patterns and best practices
- Analyzed and selected key settings features that align with the goals and context of a productivity-focused application
- Designed and implemented four new UIKit ViewControllers to expand and enhance the app's settings functionality
- Applied insights from research to create a cohesive, user-friendly interface that balances a polished, sophisticated design with an approachable and intuitive user experience
- Developed a dynamically populated "Saved Videos" interface using UICollectionView and custom UICollectionViewCells
- Implemented user interaction features using UISwitch components to control account states and permissions (e.g., public vs. private account, enabling/disabling comments and likes)
- Integrated persistent user data handling to ensure settings and preferences are saved and accurately reflected across the app
- Iteratively refined UI/UX through testing and debugging to ensure smooth navigation and consistency with the overall application design
- Designed and built multiple UIKit ViewControllers responsible for core user facing features, such as the User Profile screen, the Settings Screen, Saved Video Tabs, and Privacy Screens
- Implemented data population for the user profile screen in order to display following counts and userName data on screen, and ensure that the data and necessary text renders correctly on the screen

Deviations:

- Like/Comment/Share not implemented yet

Alpha Contributions:

Jean-Claude Bissou

- Created SwiftUI CameraView to preview video capture coming from the AVCaptureSession.
- Created SwiftUI ContentView to hold the CameraView, pass into it the ViewModel, and start transition back to UIKit
- Created a ViewModel responsible for instantiating and calling the CameraManager, and saving recording to Photos library
- Created a CameraManager responsible for starting the AVCaptureSession along with creating inputs and outputs for the session.
    - CameraManager is also for authorization of the camera, starting and stopping the session, sending frames to CameraView, and writing the video.
- Created CMSampleBuffer+Extension to convert image buffer output to CGImage
- Created CIImage+Extension to get CGImage representation of CIImage
- Created UploadVideoControllerWrapper to make present UIKit view from SwiftUI
- Created UploadVideoController to play the recorded video via URL
- Hours of reading docs, watching tutorials, and debugging to implement AVFoundation and SwiftUI to UIKit transitions

Ernest Ramos

- Designed and implemented the loading screen and initial app flow
- Created the firebase and connected the project to it
- Also created the firebase firestore database and connected that to the project
- Created the user authentication interface which ensures the the login interface works
- Created the whole create an account interface, this includes (which all follow correct protocol):
    - user email and password,
    - create a bio picture (work in progress),
    - user preferences
    - user bio
    - user username
- Created a data flow protocol, which grabs the current user that is logged data from the database, and stores it to a shared structure to share important data across all viewcontrollers
- Created the navigation tab bar interface, which permits seamless navigation between the profile and home view controllers, with the creating post index segueing to a different storyboard
- Organized and Designed the storyboard structure and UI layout to support collaborative development and minimize merge conflicts between team members
- Communicated protocols and concepts multiple times and attended every meeting with my team

Andy Trinh

- Refined the design of the profile view controller on the storyboard by refactoring it into a single collection view
    - Created the collection view such that it is comprised of a custom header collection view cell that displays the user's information such as username, profile picture, and bio, and a 3 column grid of custom cells, all of which segue to a different view controller if clicked on
- Designed and created a new view controller (TimelapseViewController) that allows the user to view the timelapse (main UI consists of a single table view)
    - Created the table view such that it is comprised of a custom header table view cell that displays the timelapse's information such as description, number of likes, and video content, multiple cells which contain comments, and a single cell purposed to drafting a new comment
- Designed and created a new view controller (FeedPageViewController) that allows the user to view the posts/timelapses queried from the database (main UI consists of a single table view)
    - Created the table view such that it is comprised of custom header table view cells, each of which displays the timelapse's information such as username, profile picture, and number of likes
- Added new segues from FeedPageViewController and ProfileViewController

Kevin Evans

- Designed and built multiple UIKit ViewControllers responsible for core user facing features, such as the User Profile screen, the Settings Screen, Saved Video Tabs, and Privacy Screens
    - Profile screen included UIImageViews and UICollectionViews utilized to display user data such as the user profile image and username. Space is left in the view in order to enable future development of an automatically populated feed of user generated content
    - Settings, Saved Videos, and Privacy screens included UICollectionViews, Toggle Buttons, Buttons, Labels, and Text elements all arranged in according to the original design document
- Implemented data population for the user profile screen in order to display following counts and userName data on screen, and ensure that the data and necessary text renders correctly on the screen
- Set up and implemented the UICollectionView for the Profile page
    - Created the initial set of UICollectionViewCells that will later be dynamically populated to display user content
- Helped develop the initial implementation of the UITabBarController / Navigation Controllers
- Sourced icons / images to save in the project assets folder for future use
    - Mostly from flaticon.com
